

Python Interview Questions

Day 01 • Questions & Answers

1. What is Python?

Answer: Python is a high-level, interpreted, general-purpose programming language known for its simple and readable syntax.

2. Why is Python popular?

Answer: Python is popular because it has simple syntax, a large collection of libraries, strong community support, and can be used for many areas such as web development, automation, data analysis, AI, and machine learning.

3. What is a variable in Python?

Answer: A variable is a name used to refer to a value or object. Python does not require us to declare the variable's data type explicitly because it is dynamically typed.

4. What are the common built-in data types in Python?

Answer: Common built-in data types are int, float, complex, str, bool, list, tuple, set, and dict.

5. What is the difference between = and == in Python?

Answer: = is the assignment operator. It is used to assign a value to a variable. == is the comparison operator. It is used to check whether two values are equal.
